# 1 Introduction

Consumers who own a car are often required to purchase car insurance to protect themselves from serious financial repercussions of being involved in a car accident. Insurance Providers must determine the risk of offering insurance coverage to a new customer through accurate statistical models that evaluate the consumers propensity for accidents. Since Insurance Providers are motivated by collecting the maximum amount of revenue from consumers while returning the lowest amount in accident claims, statistical modeling provides Insurance Providers with insight into the consumers behavior and the most appropriate pricing schemes<sup>1</sup>.

## 2 Statement of the Problem

The purpose of this report is to develop statistical models to make inference into the likelihood of a customer being involved in a car accident and the cost associated of a customer being involved in a car accident.

## 3 Data Exploration

### 3.1 Variables Explained

The variables provided in the Insurance Training Data Set are explained below:

Variable Code	Definition
INDEX	Identification Variable (do not use)
TARGET_FLAG	Was Car in a crash? 1=YES 0=NO
TARGET_AMT	If car was in a crash, what was the cost
AGE	Age of Driver
BLUEBOOK	Value of Vehicle
CAR_AGE	Vehicle Age
CAR_TYPE	Type of Car
CAR_USE	Vehicle Use
CLM_FREQ	# Claims (Past 5 Years)
EDUCATION	Max Education Level
HOMEKIDS	# Children at Home
HOME_VAL	Home Value
INCOME	Income
KIDSDRIV	# Driving Children
MSTATUS	Marital Status
MVR_PTS	Motor Vehicle Record Points
OLDCLAIM	Total Claims (Past 5 Years)
PARENT1	Single Parent
RED_CAR	A Red Car
REVOKE	License Revoked (Past 7 Years)
SEX	Gender
TIF	Time in Force
TRAVTIME	Distance to Work
URBANICITY	Home/Work Area
YOJ	Years on Job

<sup>1</sup>"Insider Information: How Insurance Companies Measure Risk - Insurance Companies.com." Insurance Companiescom. N.p., n.d. Web. 06 Nov. 2016.

### 3.1.1 Nominal Variables

We first look at our nominal variables and their applicable proportions. Interestingly, we see that in this data set only a quarter of the customer records indicate an accident occurred. Also, the majority of consumers in this data set have no kids at home, are married, more than a high school education but less than a PhD, use their car for private purposes, typically own a SUV or minivan, and also live in an urban environment. This provides an interesting insight to the type of customer this data set represents and should be considered when further interpreting our statistical model. Additionally, we should be mindful of any selection biases in this data set as consumers with extremely risky histories are likely to have not been extended insurance coverage.

Table 2: Table of nominal variables

Variable	Levels	n	%	$\sum\%$
TARGET_FLAG	0	6008	73.6	73.6
	1	2153	26.4	100.0
	all	8161	100.0

	all	8161	100.0	

### 3.1.2 Continuous and Discrete Variables

We can see that in our continuous and discrete variables there is some additional variability. The median claim amount (TARGET\_AMT) is 0 which would coincide with only a quarter for records indicating an accident. However, the spread is large since the average payout is only \$1,504.30 but the maximum payout was \$107,586.10. Surprisingly, the median AGE is 45 and the average AGE is 44.8 years, while we expected a lower average it could be due to simple selection bias in the data set source or the aging US population bringing this average higher <sup>2</sup>. We also noticed that an INCOME of \$0.00 seems unwise because it is unclear how the individual would be able to cover their premium costs without parental support. Finally, we should note that the data set has as CAR\_AGE of -3, which is impossible and will need to be removed.

There are many missing values for this portion of our data set, we have over 400 values missing for years on the job, income, home value, and car age. Due to these missing values we will need to impute to complete our statistical model.

Variable	n	Min	q <sub>1</sub>	$\tilde{x}$	$\bar{x}$	q <sub>3</sub>	Max	s	IQR	#NA
TARGET_AMT	8161	0	0	0	1504.3	1036	107586.1	4704.0	1036	0

## 3.2 Imputing Missing Values

In order to address the missing values in our variables we used a non-parametric imputation method (Random Forest) using the `missForest` package. The function is particularly useful in that it can handle any type of input data and it will make as few assumptions about the structure of the data as possible.<sup>3</sup>

Figure 1: Correlation Plot of Training Data Set

### 3.3 Exploration of Variables

#### 3.3.1 Correlation Matrix

If we widen our data set to a matrix to account for the many factors in our evaluation data set we can plot a correlation matrix. We can see some interesting patterns in the data.

- It is intuitive how both target variables have no correlation with an education level that is less than high school. If the person who wants to buy the vehicle does not have a sufficient level of education, obviously he or she would not have a high-paying job and therefore would not be able to buy the vehicle.
- Not surprisingly, the TARGET\_FLAG variable has negative correlation with marital status. If a married couple owns the vehicle and both the husband and wife share the vehicle, each of them would have to be careful while driving it so as to not get into any accident.
- We see that the TARGET\_FLAG variable is negatively correlated with bluebook value. If the bluebook value is high then that means that the car would be very expensive and the owner would likely not want to get the new car into an accident. Otherwise the owner may see their premiums increase sharply after the accident.

## 4 Data Transformation

### 4.1 Outliers Treatment

We chose winsorizing as the method to address outliers. Instead of trimming values, winsorizing uses the interquartile range to replace values that are above or below the interquartile range multiplied by a factor. Those values above or below the range multiplied by the factor are then replaced with max and min value of the interquartile range. Using the factor 2.2 for winsorizing outliers is a method developed by Hoaglin and Iglewicz and published Journal of American Statistical Association in 1987<sup>4</sup>.

The below table is the summary results of the winsorizing of the data.

Table 4:

Statistic	N	Mean	St. Dev.	Min	Max
INCOME	8,161	61,225.430	45,828.110	0.000	210,660.000

<sup>4</sup>Hoaglin, D. C., and Iglewicz, B. (1987), Fine tuning some resistant rules for outlier labeling, Journal of American Statistical Association, 82, 1147-1149.

## 4.2 BoxCox Transformations

The Box-Cox transformations were done only on three of the input variables - income, house value, and the total number of claims during the past 5 years. These transformations were done based on the residual plots. In the residual plots, these three variables showed a great deal of non-constant variance because the plots were funnel-shaped.

Non-constant Variance Score Test Variance formula: ~ KIDSDRV + AGE + HOMEKIDS + YOJ + INCOME + PARENT1 + HOME\_VAL + MSTATUS + SEX + EDUCATION + JOB + TRAVTIME + CAR\_USE + BLUEBOOK + TIF + CAR\_TYPE + RED\_CAR + OLDCLAIM + CLM\_FREQ + REVOKED + MVR\_PTS + CAR\_AGE + URBANICITY  
 Chisquare = 5720.739 Df = 36 p = 0

```

## CAR AGE       -0.464   0.642 
## URBANICITY      NA     NA  
## Tukey test      8.684   0.000
```

Using the `BoxCox.lambda` function from the `forecast` package we are able to determine our necessary transformations to our independent variables.

$\lambda$	Variables
0.268842617694589	INCOME
0.505233636014921	HOME_VAL
0.456635555660553	TRAVTIME

Utilizing the below table of common transformations based on the lambda value of the BoxCox we further transform our independent variables.

Common Box-Cox Transformations<sup>5</sup> <sup>6</sup>

$\lambda$	$Y'$
-2	$Y^{-2} = \frac{1}{Y^2}$
-1	$Y^{-1} = \frac{1}{Y^1}$
-0.5	$Y^{-0.5} = \frac{1}{\sqrt{(Y)}}$
0	$\log(Y)$
.25	$\sqrt[4]{Y}$
0.5	$Y^{0.5} = \sqrt{(Y)}$
1	$Y^1 = Y$
2	$Y^2$

Lambda values were truncated to the nearest tenth that match a common transformation as per the below table.

variable	variable transformation
INCOME	$\sqrt[4]{INCOME}$
HOME VAL	$\sqrt{(HOME VAL)}$
TRAVTIME	$\sqrt{TRAVTIME}$

## 5 Models Built

### 5.1 Logistic Regressions 1 - Backwards Selection Method

In the backwards selection model, the resulting AIC was 7,703.13. All of the variables remain except the age of the driver, sex, whether the car was red or not, number of kids at home, and car age. Zero correlation for bluebook value is a result of our transformations. As the bluebook value increases, the log odds that the vehicle gets into a crash decreases.

## 5.2 Logistic Regression 2 - Forwards Selection Method

In the forwards selection model, the resulting AIC was 7,712.07. All of the variables remain in the model. The coefficients are relatively similar to the previous model, while BLUEBOOK and OLDCLAIM are significant they have very low coefficients and therefore don't explain a great deal of the log odds.

Table 12:

### 5.3.2 Subset Model

The variables as indicated in column 8 of the previous table will be further implement into our subset selection model in the following table. In the subset selection model, the resulting AIC was 7,708.37. Very few of the variables remained. These variables were number of kids driving, income, marital status, job category, car use, whether the license was revoked or not, urbanicity, and motor vehicle record points. In this model, the target variable has a stronger correlation with urbanicity than it does in the other logistic models.

URBANICITY	1.084428	1	1.041359	1.084428

## 5.4 Linear Regression 1 - Backwards Selection

In the backwards linear regression model, the variables eliminated were the number of years on the job, whether the car is red or not, number of kids at home, total claims within the past 5 years, and age of the driver. The target variable has the strongest correlation with the urbanicity. Due to our transformation of the income variable, income does have some correlation now with the target amount. Before our transformation there was no correlation at all between these two variables.

#### 5.4.1 Linear Regression 1 - Backwards Selection Model Metrics

## 5.5 Linear Regression 2 - Forwards Selection

In the forwards linear regression model, the variables eliminated were the same as the variables eliminated in the backwards linear regression. Additionally, we removed HOME\_VAL and BLUEBOOK because they did not appear to be significant in the previous model. Just like the previous model, the target variable has the strongest correlation with urbanicity.

Table 26:

	fwdFitstep
Constant	357.964 (460.236)

### 5.5.1 Linear Regression 2 - Forwards Selection Model Metrics

## 6 Selected Models

Of note, the urban and rural flag had the most influence on both Target variables. This is not surprising as someone living in an urban environment is driving their car among many other cars and it is intuitive that accidents would be more likely in this environment.

### 6.1 Logistic Regression Selected

Logistic Regression Model Metrics

Out of all the logistic models, the Subset Selection Model rated the best due to the highest accuracy. The AIC for this model was not the lowest. However, the difference between this AIC (7708.37) and the lowest AIC (7703.13) is not too much. Additionally, it is a simpler model with a better precision. This is why we chose this model over the other two.

	Model Metrics for Forwards Selection	Model Metrics for Subset Selection	Model Metrics for Backwards Selection with best threshold
<b>accuracy</b>	0.725	0.778	0.733
<b>classif.error</b>	0.275	0.222	0.267
<b>precision</b>	0.486	0.640	0.496
<b>sensitivity</b>	0.762	0.364	0.747
<b>specificity</b>	0.711	0.927	0.728
<b>f1score</b>	0.594	0.464	0.596
<b>auc</b>	0.670	0.786	0.672
<b>best.threshold</b>	0.310	0.280	0.320
<b>aic</b>	7712.070	7708.369	7703.130
<b>CVError</b>	0.151	0.154	0.151

Our Final Logistic Model (Subset Selection Method):

$$\begin{aligned}\log(TARGETFLAG) = & -469 * KIDSDRV + -0.085 * \sqrt[4]{INCOME} + -0.748 * MSTATUSYEs \\ & + 0.148 * JOBClerical + -0.972 * JOBDoctor + -0.421 * JOBHomeMaker \\ & + -0.466 * JOBLawyer + -0.954 * JOBManager + -0.398 * JOBProfessional \\ & + -0.343 * JOBStudent + -0.725 * CARUSEPrivate + 0.752 * REVOKEDYEs \\ & + 0.151 * MVPTS + 2.282672 * URBANICITYHighlyUrban/Urban + -1.135467\end{aligned}$$

## 6.2 Linear Regression Selected

In the linear models rendered, some of the correlation coefficients do make sense. For example, in both models, it would make sense for a student to have to pay less in a car crash due to the fact that the student would spend more time studying and less time on the road. It would also make sense for urbanicity to affect the cost during a car crash because in urban areas, there are more people and pedestrians and the probability of people getting killed in a car crash would be very high as opposed to rural areas where there would be less pedestrians. However, while both models have the same adjusted R<sup>2</sup>, the Forward Selection Model has fewer variables which makes it easier to understand and is therefore the selected Linear Regresion.

Our Final Linear Model (Forward Selection Method):

$$\begin{aligned} TARGETAMT = & 170.55 * MVRPTS + 1,674.58 * URBANICITYHighlyUrban/Urban \\ & + 61.16 * JOBClerical + -1,209.74 * JOBDoctor + -318.80 * JOBHomeMaker \\ & + -338.710 * JOBLawyer + -1,029.96 * JOBManager + 11.61 * JOBProfessional \\ & + -377.47 * JOBStudent + -601.84 * MSTATUSYEs + -829.33 * CARUSEPrivate \\ & + 376.86 * KIDSDRV + 463.35 * CARTYPEPanelTruck + 362.62 * CARTYPEPickup \\ & + 923.23 * CARTYPESportsCar + 668.78 * CARTYPESUV + 591.35 * CARTYPEVan \\ & + -47.8 * TIF + 132.59 * \sqrt{TRAVTIME} \\ & + 642.15 * PARENT1YEs + -44.23 * \sqrt[4]{INCOME} \\ & + 434.91 * REVOKEDYEs + -27.49 * CARAGE + 107.28 * CLMFREQ + 247.62 * SEXM \\ & + 185.76 * EDUCATIONHighSchool + 284.79 * EDUCATIONLessThanHighSchool \\ & + 356.36 * EDUCATIONMasters + 651.01 * EDUCATIONPhD \end{aligned}$$

### 6.3 Predictions using Final Model on Evaluation Data Set

The Evaluation Data Set needed to be data cleansed much like our Training Data Set. We modified the Evaluation Data Set variables to conform to the Training Data Set and we also imputed the missing values in the Evaluation Data Set in order to be able to make predictions.

The below table represents our predictions as indicated in column TARGET\_FLAG and TARGET\_AMT using our final models and using the provided evaluation data set after transformation.

### 7.2 Data Dictionary

Variable Code	Definition
INDEX	Identification Variable (do not use)
TARGET_FLAG	Was Car in a crash? 1=YES 0=NO
TARGET_AMT	If car was in a crash, what was the cost
AGE	Age of Driver
BLUEBOOK	Value of Vehicle
CAR_AGE	Vehicle Age
CAR_TYPE	Type of Car
CAR_USE	Vehicle Use
CLM_FREQ	# Claims (Past 5 Years)
EDUCATION	Max Education Level
HOMEKIDS	# Children at Home
HOME_VAL	Home Value
INCOME	Income
KIDSDRV	# Driving Children
MSTATUS	Marital Status
MVR_PTS	Motor Vehicle Record Points
OLDCLAIM	Total Claims (Past 5 Years)
PARENT1	Single Parent
RED_CAR	A Red Car
REVOKE	License Revoked (Past 7 Years)
SEX	Gender
TIF	Time in Force
TRAVTIME	Distance to Work
URBANICITY	Home/Work Area
YOJ	Years on Job
